**Abstract**

**Background:** Post-ERCP pancreatitis (PEP) is a feared complication of ERCP, and occurs in up to 20% of high-risk patients. Proton pump inhibitors (omeprazole, esomeprazole) are widely used for different indications; their therapeutic role in pancreatitis is unclear. **Methods:** A single-center retrospective case-control study was conducted to evaluate the potential effect of PPIs in preventing PEP. All patients who underwent ERCP between January 2007 and February 2012 were included. After obtaining IRB approval, all medical records were reviewed and data was collected for laboratory blood work done before and after the procedure, home and newly prescribed medications, in addition to the detailed operative notes. PEP was defined based on new onset abdominal pain requiring hospitalization for at least 2 nights and elevation of lipase and/or amylase R3 times the upper limit of normal at least 24 hours after the procedure. Univariable and multivariable analyses were performed to compare rates of PEP in the group of patients who received IV antibiotics, PPI, or both; analysis adjusted for potential or suspected confounding factors. **Results:** Among the 197 ERCPs done during the study period, the average age was found to be 62.3 (86-27), 107 patients were females and average BMI was 26.9 (44.6-16.4). Laboratory blood work showed an average WBC of 7.8 (19.6-3), hematocrit of 35.7 (54-22.9), BUN of 16 (36-3), creatinine of 1 (4.4-39), AST of 97 (944-10), calcium of 8.6 (10.3-8.6) and an LDH 250 (505-153). A total of twelve patients developed PEP, out of which nine had severe PEP, two had moderate PEP and one had mild PEP. Lipase level was (10359-4697). In-group (1) [patients who used PPI], out of ninetyeight patients, seven had PEP (6 severe PEP, 1 mild PEP) as compared to group (2) [patients who did not use PPI], where 5 patients had PEP (3 severe, 2 moderate). There was no statistically significant difference in the incidence and severity of PEP between group (1) and group (2) (p-value=0.538). Table 1 presents a list of variables considered in our study, that even after adjusting for these variables and exploring other models, no associations were found between PPI and PEP. [Table 1] History of PEP, female gender, difficult cannulation/failed attempt was significantly associated with an increased incidence of PEP. However, pancreatic stent placement, diabetes mellitus, obesity, and history of acute pancreatitis were not associated with increased incidence of PEP [Table 1]. High Pre-ERCP blood sugar failed to show association with PEP (p-value=0.0841) (Fig.1). **Conclusion:** Our study did not show significant evidence to support the role played by (PPI) in decreasing the incidence or severity of post-ERCP pancreatitis. Further randomized controlled studies are needed. (Table presented) (Figure presented).

abstract, and full texts

The screenshot shows the EndNote X7 interface. The left sidebar displays the 'My Library' structure, including 'All References (4636)', 'Duplicate References (294)', 'Imported References (0)', 'Unfiled (4619)', and 'Trash (445)'. Under 'My Groups', there are three folders: 'Abstract (0)', 'Full-text (0)', and 'Title (17)'. A red arrow points from the 'Title' folder to the 'Title' column of the reference list. The reference list has columns for 'Year' and 'Title'. The references listed are:

Year	Title
1974	Trasylol for pancreatitis
1989	Pentamidine aerosol to prevent Pneumocystis carini
1995	test your knowledge
1995	Pegaspargase for acute lymphoblastic leukemia
1996	Case n. 1, 1996: Acute pancreatitis and sudden amau
1998	United Kingdom guidelines for the management of
1999	Minerva
2001	[Acute pancreatitis. Conclusions and recommendatic
2002	Continuing medical education program
2002	Acute pancreatitis; target intensive therapy to those
2005	Consensus on the diagnosis and treatment of acute p
2005	Safety of aggressive statin therapy
2005	First reports of adverse drug reactions (ADRs) in rec
2006	What did year 2005 bring us? New drugs, developm
2007	Olanzapine-induced pancreatitis due to chylomicron
2008	Cotrimoxazole is generally used to manage Pneumo
2008	Update: Snippets of science

# Compressed Library

Másik gépre vihető és ott használható a létrehozott adatbázis az állapota pontos megőrzése mellett. A megnyitáskor egy env. és egy data. mappa generálódik, vigyázzunk, hogy ne tartsuk ezeket az archívummal azonos mappában azonos névvel (mentésnél gondot jelenthet és adatvesztést okozhat). Az env. és data. fájlok átnevezésénél mindkettőt azonos névre nevezzük, mivel ezek összetartozó fájlok. Ettől való eltérés adatvesztést okozhat.
